

Hough transform for circles

- Circle: center (a, b) and radius r $(x_i - a)^2 + (y_i - b)^2 = r^2$
- For a fixed radius r , unknown gradient direction:

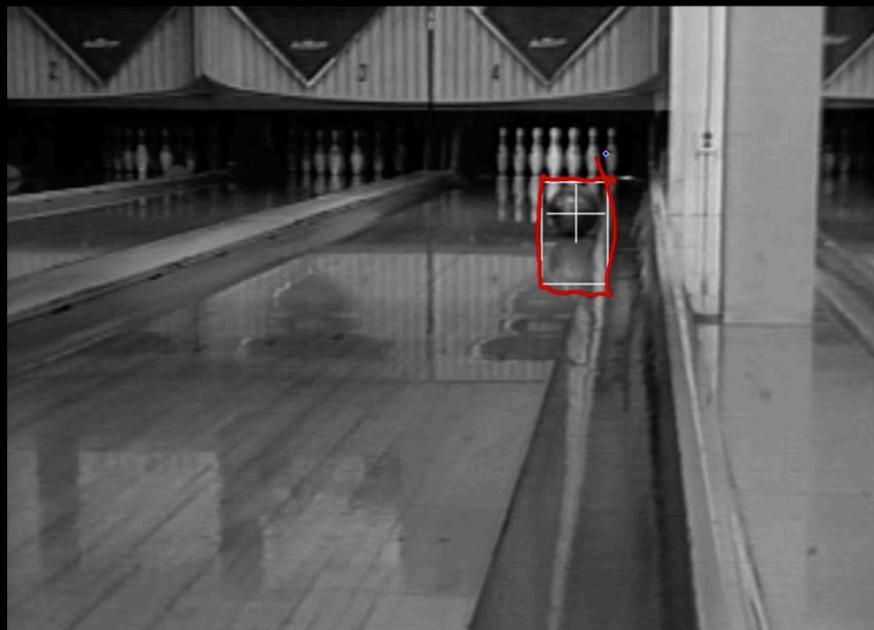

Hough transform for circles

- Circle: center (a, b) and radius r $(x_i - a)^2 + (y_i - b)^2 = r^2$
- For a fixed radius r , unknown gradient direction:

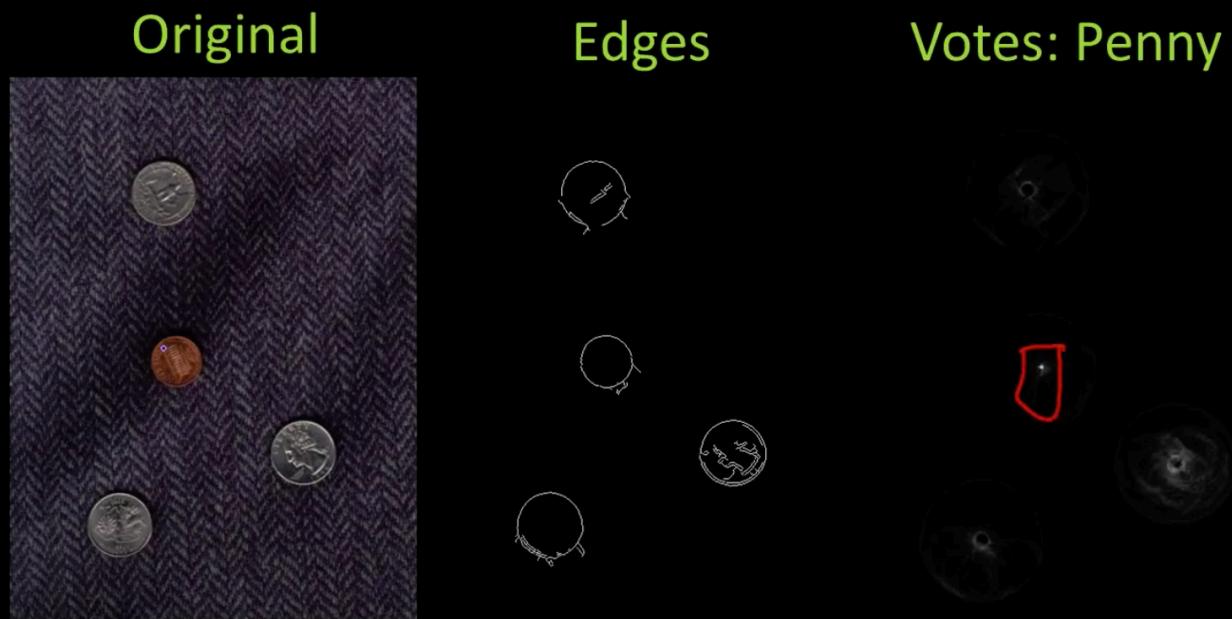

Example: detecting circles with Hough

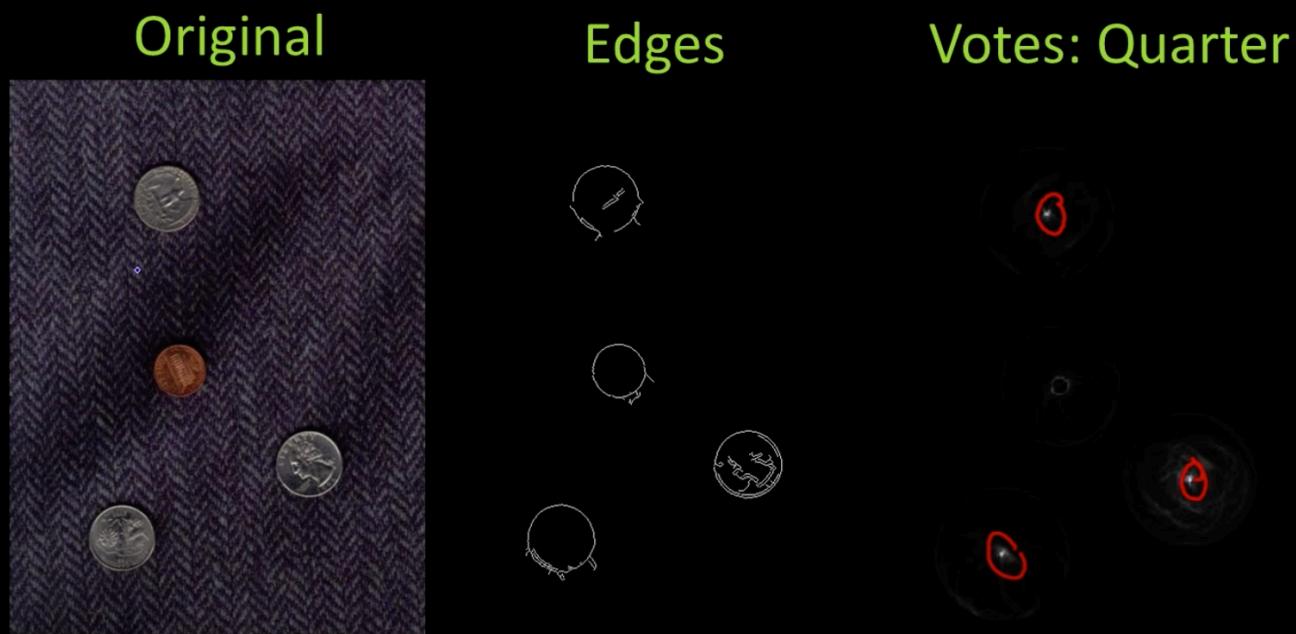

Crosshair indicates results of Hough transform;
bounding box found via motion differencing.

Example: detecting circles with Hough

Note: a different Hough transform (with separate accumulators) was used for each circle radius (quarters vs. penny).

Example: detecting circles with Hough

Note: a different Hough transform (with separate accumulators) was used for each circle radius (quarters vs. penny).

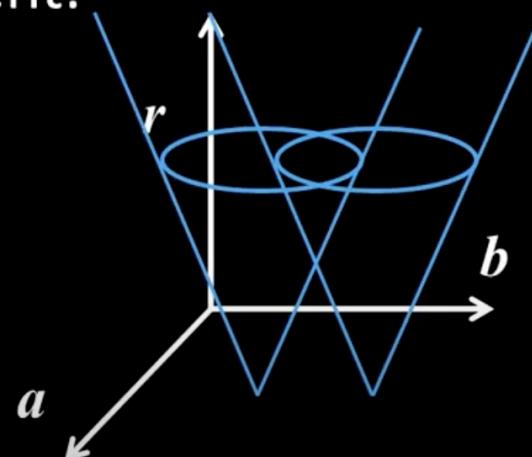

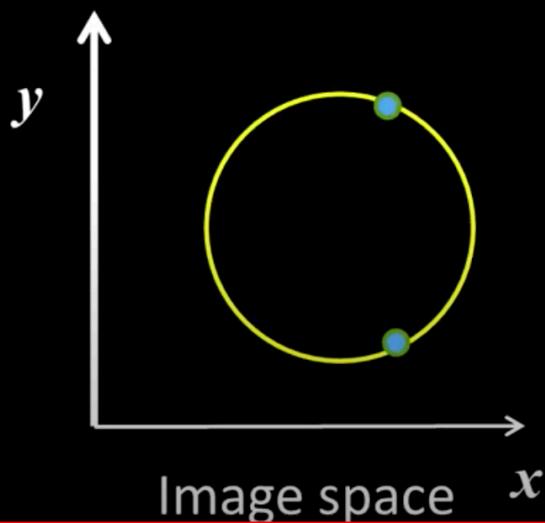

Example: detecting circles with Hough

Combined
detections

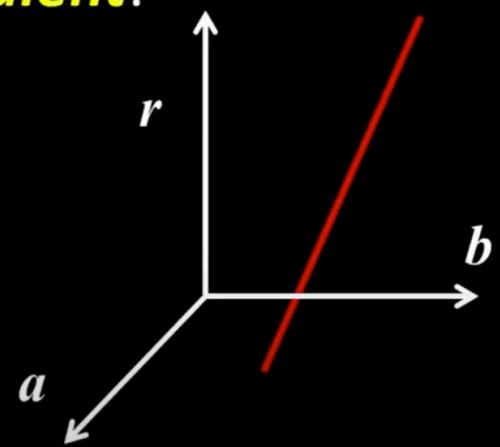

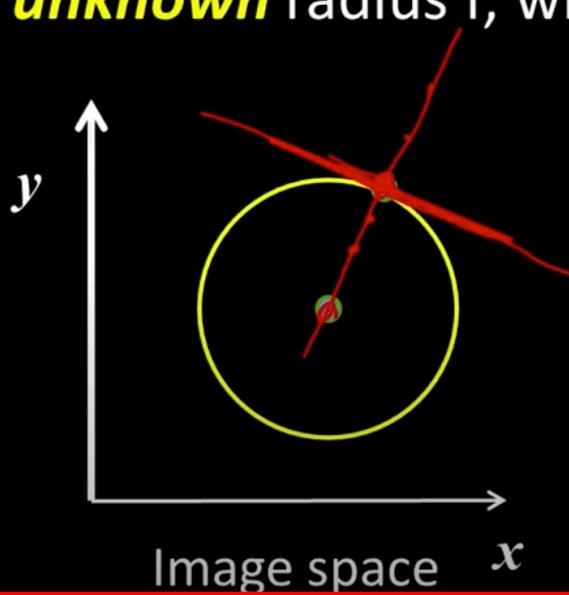

Hough transform for circles

- Circle: center (a, b) and radius r $(x_i - a)^2 + (y_i - b)^2 = r^2$
- For **unknown** radius r , no gradient:

Hough transform for circles

- Circle: center (a, b) and radius r $(x_i - a)^2 + (y_i - b)^2 = r^2$
- For **unknown** radius r , with **gradient**:

Hough space

Hough transform for circles

1. For every edge pixel (x, y) :
2. For each possible radius value r :
3. For each possible gradient direction θ :
 ~~%% or use estimated gradient~~
4. $a = x - r \cos(\theta)$
5. $b = y + r \sin(\theta)$
6. $H[a, b, r] += 1$
7. end
8. end
9. end

Voting: practical tips

- Minimize irrelevant tokens first (take edge points with significant gradient magnitude)
- Choose a good grid / discretization:
 - Too coarse: large votes obtained when too many different lines correspond to a single bucket
 - Too fine: miss lines because some points that are not exactly collinear cast votes for different buckets

Voting: practical tips

- Vote for neighboring bins (like smoothing in accumulator array)
- Utilize direction of edge to reduce free parameters by 1
- To read back which points voted for “winning” peaks, keep tags on the votes

Parameterized Hough transform: pros and cons

Pros

- All points are processed independently, so can cope with occlusion
- Some robustness to noise: noise points unlikely to contribute consistently to any single bin
- Can detect multiple instances of a model in a single pass

Parameterized Hough transform: pros and cons

Cons

- *Complexity of search time increases exponentially with the number of model parameters*
- Non-target shapes can produce spurious peaks in parameter space
- Quantization: hard to pick a good grid size
